Architecture Design

INTRODUCTION

The Swing toolkit uses a modified MVC design pattern. It has a single UI object for both the view and the controller. This modified MVC is sometimes called a separable model architecture. The model is used for various kinds of buttons like push buttons, check boxes, radio boxes and for menu items.

INTERACTION

In the Swing toolkit, every component has its model, even the basic ones like buttons. There are two kinds of models in Swing toolkit:

- state models
- data models

The state models handle the state of the component. For example the model keeps track whether the component is selected or pressed. The data models handle data they work with.

Architecture Design

MODEL

Package – com.risk.model

- AttackPhaseModel
- ConfigureMapModel
- EditMapModel
- FortificationPhaseModel
- GameDriverModel
- ParseMapFileModel
- PlayerClass
- PlayerDominationModel
- ReinforcementPhaseModel
- ResourceManager
- SaveAndLoadGame
- SaveMapUponConfigModel
- SaveMapUponEditModel
- StartUpPhaseModel
- TournamentModeModel

Package – com.risk.behavior

- PlayerBehaviourInterface
- AggressiveBehaviorImpl
- BenevolentBehaviorImpl
- CheaterBehaviorImpl
- HumanBehaviorImpl
- RandomBehaviorImpl
- StrategyContext

UI AND CONTROLLER

Package – com.risk.ui

- CardExchangeUI
- ConfigureMapUI
- DeployArmiesUI
- EditMapUI
- FortificationUI
- GameModeUI
- MainMenuUI
- MapEditorMenuUI
- PhaseUI
- PlayerDominationView
- ReinforcementsUI
- SaveMapUponConfigUI
- SaveMapUponEditUI
- TournamentModeUI
- UploadMapUI

Design Patterns Used

1. Observer Pattern

- The observer pattern is a software design pattern in which an object, called the subject or observable, maintains a list of its dependents, called observers, and notifies them automatically of any state changes, usually by calling one of their methods.
- In the game, at multiple instances this pattern has been used.
- JDK 1.0 defined Observer interface and Observable class have been used to achieve this design pattern in the project.
- For example – PlayerClass.java is an Observable and its observers are PhaseUI and PlayerDominationView

2. Strategy Pattern

- It is a behavioral software design pattern that enables selecting an algorithm at runtime.
- The strategy pattern defines a family of algorithms, encapsulates each algorithm, and makes the algorithms interchangeable within that family.
- In the project, the strategy pattern is used to switch to different behaviors as per the player whose turn comes up.
- The different player behaviors implemented using the Strategy Patterns are aggressive, benevolent, cheater, random and human behaviors.

Coding Conventions

INTRODUCTION

Coding conventions are a set of prescriptive rules that pertain to how code is to be written, including:

Indentation: this depicts how the code has been arranged with proper syntax to maximize readability.

Comments: how to consistently and efficiently one uses comments to help program understandability.

Declarations: what syntax to use to declare variables, data structures, classes, etc. to maximize code readability.

Naming: this allows us to decide how to name the entities of a program so that it relates well with the project and increases understandability.

Coding Conventions

Why is it needed?

Coding Conventions play a very important role in development. Though they improve the internal quality of the code rather than affecting any external visible quality.

In general, having proper or fixed coding conventions allows to:

- **Maximize the productivity**
- **Increasing readability**
- **Maximizing understandability**
- **Increasing the sustainability of the development**

Coding Conventions

Coding Conventions and Standards adopted in project

1. Code Layout

- Approach used - Maximize visibility of the different blocks by having curly braces alone on their line of code.
- Blank lines have been introduced in between the code, to increase the readability.

2. Naming Conventions

- **Constants** have been names with upper case including underscores as separators.
- **Classes** have been named as per the architecture adopted and under the package.
- All class names start with upper case letter and words are separated using case change.
- The variables used are named per their scope.
- **Methods** name start with lower case and are followed by parentheses. **Camel case** is followed.
- Attributes start with lower case and are separated with underscores.
- Local variables are entirely lower case without underscore.

Coding Conventions

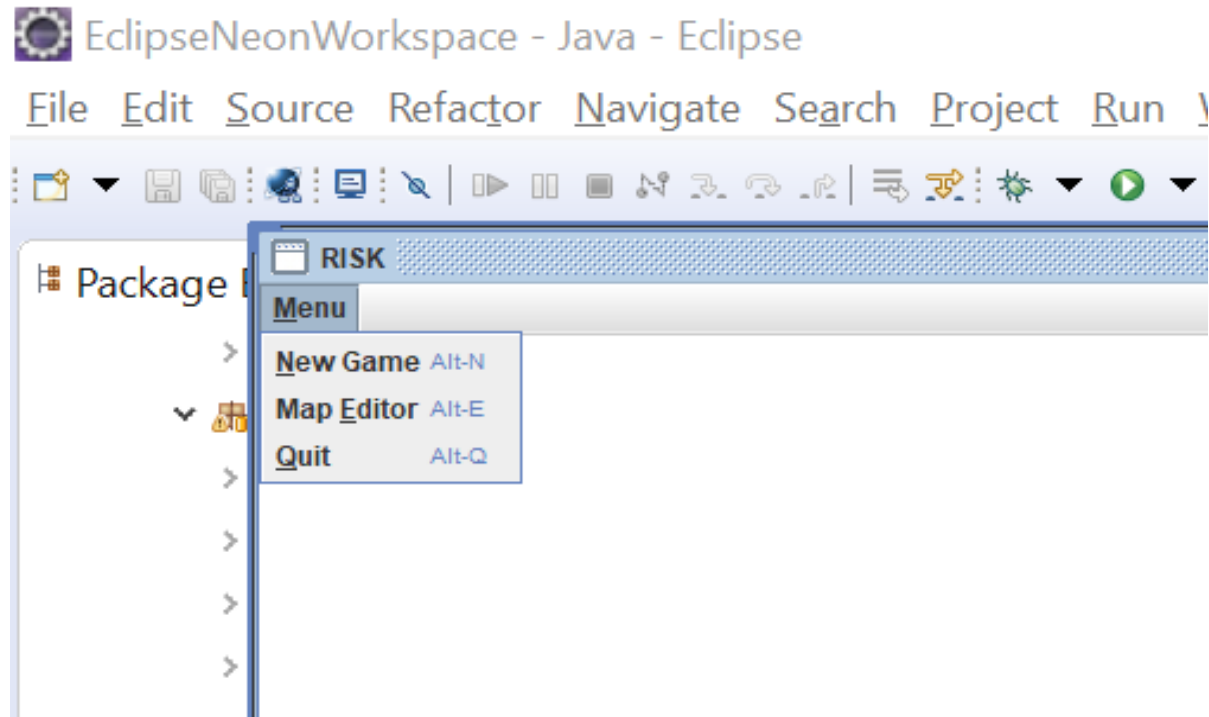

3. Comments

- Commenting is done as per conventions for JavaDoc.
- The purpose is stated at the beginning of every class or file.
- Each method has comments explaining its function as well as parameter and return type.
- Each class variable has comments above it explaining its purpose.

4. Indentation

- The code has been indented as per standards to improve code readability.

RISK Menu Options

Screenshots

Game Modes

Screenshots

The screenshot shows a window titled "Tournament mode" with the following configuration options:

- No.Of Games:** A dropdown menu currently set to 2.
- No.Of Game Turns:** A numeric input field set to 10, with up and down arrow buttons.
- Select Player Mode:** A list box with four options: Aggressive, Benevolent, Random, and Cheater. The "Random" option is currently selected.
- No.Of Maps:** A dropdown menu currently set to 2.
- Buttons:** Two buttons labeled "Upload Map1" and "Upload Map2" are positioned below the map count dropdown. A "Close" button is located at the bottom center of the window.
